-----------------	-------------------

**Identify two companies (whose employees have made presentations in CIS454) that use substantially different software development processes.**

**For both companies,**

- **Mention what processes they have adopted**
- **Also elaborate on why you think they use them.**

Most companies presented using agile processes. They have implemented these processes in separate ways. The people at google implemented their agile process focusing on a template if they develop the product and then go through a series of checks to make sure the product is up to standard. IBM does this differently by using an agile process but consistently worrying about the guidelines along with the process. Google is more focused on consumer-based products so having things revolve the consumer is naturally a better way to go. IBM is more focused on businesses, so they need to take regulations into account first when making decisions. Their focuses are completely different and drive their agile style so.
